

Note

A Compilation of Radiocarbon Dates from Disko Bugt, Central West Greenland.

Morten Rasch

188 new and previously published radiocarbon dates on Holocene material from Disko Bugt, central West Greenland, are presented together with relevant informations (laboratory number, place name, dated material, geographic coordinates, altitude and $\delta^{13}\text{C}$ -value) about the dates.

Morten Rasch: Danish Polar Center, Strandgade 100 H, 1401 Copenhagen K., Denmark.

This note contains a compilation of radiocarbon dates on Holocene organic material from altitudes below 150 m a.s.l. in Disko Bugt ($68^{\circ}30'\text{N}$ - $70^{\circ}45'\text{N}$; $50^{\circ}00'\text{W}$ - $55^{\circ}30'\text{W}$), central W.Greenland. A locality map showing the field location of the dated samples is given in Fig. 1 (see next page). Table 1 contains the radiocarbon dates and relevant information (laboratory number, place name, dated material, geographic coordinates, altitude and $\delta^{13}\text{C}$ -value) about the dates. In both Fig. 1 and Table 1 place names are spelled in accordance with current Greenlandic orthography. Thus, the place names might differ a little from the similar place names on current topographic maps.

Corrections of Dates

In Table 1, all dates on terrestrial material (incl. mud) with $\delta^{13}\text{C}$ -values given have been corrected for isotopic fractionation by normalizing to $\delta^{13}\text{C} = -25.0\text{‰ PDB}$, while all dates on marine material with $\delta^{13}\text{C}$ -values given have been corrected for isotopic fractionation by normalizing to $\delta^{13}\text{C} = 0.0\text{‰ PDB}$. The numbers in the column 'Corr. type' in Table 1 have the following meanings: 1. The date has not been corrected for isotopic fractionation. 2. The date was corrected for isotopic fractionation by the laboratory/author(s) of first publication. 3. The date has been corrected for isotopic fractionation in this work.

No corrections for marine reservoir effects have been made to the dates. The marine reservoir effect in West Greenland is considered to be 410 years (Rasmussen & Rahbek 1996), which is by chance equal to the correction already done by normalizing the dates on marine material to 0.0 ‰ PDB (Mook & van de Plassche 1986).

Dates without $\delta^{13}\text{C}$ -measurements are normally not corrected for isotopic fractionation by the laboratories. However, the Tandem Accelerator Laboratory in Uppsala assume $\delta^{13}\text{C}$ -values depending on the dated material, and they correct their dates for isotopic fractionation according to the assumed $\delta^{13}\text{C}$ -values. Date UA-1785 was assumed by the laboratory in Uppsala to have a $\delta^{13}\text{C}$ -value of -21.0 ‰ PDB. The laboratory corrected the date to $\delta^{13}\text{C} = -25.0\text{‰ PDB}$. Later, Bennike et al. (1994) have corrected the date to $\delta^{13}\text{C} = 0.0\text{‰ PDB}$. Dates UA-1786, UA-1788, UA-1789 and UA-1790 were assumed by the laboratory in Uppsala to have $\delta^{13}\text{C}$ -values = 0.0 ‰ PDB. The laboratory corrected the dates to $\delta^{13}\text{C} = -25.0\text{‰ PDB}$. Later, Bennike et al. (1994) have corrected the dates to $\delta^{13}\text{C} = 0.0\text{‰ PDB}$. The corrections of Bennike et al. (1994) have been applied in this work, because they make the Uppsala dates comparative with uncorrected dates. Besides the dates from Uppsala, all dates without $\delta^{13}\text{C}$ -values have not been corrected for isotopic fractionation. Errors introduced by lack of $\delta^{13}\text{C}$ corrections are considered to be less than ± 80 years on shell samples, while dates on terrestrial samples are considered to be up to 200 years too young.

Acknowledgements

B. Grønnow, U. Rahbek and J. Meldgaard are thanked for putting unpublished datings at my disposal. O. Humlum is thanked for clarifying uncertainties about the geographical coordinates of some of the datings from Disko. U. Rahbek and J. Heinemeier are thanked for critical comments.
