Abstract

For half a century information on the genealogy of the Polar Eskimos has been collected from all possible sources by the authors. In this way the Polar Eskimo Genealogy, presented here, goes back 6-7 generations in several cases from December 31, 1973 to the middle of the nineteenth century. In order to store this huge amount of genealogical information and to be able to follow the kinship relations a special family diagram combined with a code system has been developed. The main part of this article is made up of 630 family diagrams containing the genealogical data for each Polar Eskimo nuclear family separately, in such a way that family relationships can easily be followed in all directions. An explanation to the code system is found in front of the family diagrams.

Polar Eskimo genetical and anthropological data (collected in 1963) are given in tables in four appendices: (A) Polar Eskimo Blood Groups. (B) Polar Eskimo Finger- and Palmprints. (C) Polar Eskimo Eye and Earlobe data. (D) Polar Eskimo anthropometrical data. The code system makes it possible to use the genealogy and the genetical markers together.

Preface

The northernmost human native population on Earth, the Polar Eskimos, live as hunters in the Thule District (75°–79°30' North and 58°–74° West) in North Greenland. Formerly they lived an isolated life, supporting themselves with the natural resources of their land. Through increasing adaptation to outside influences they have slowly grown dependent on supplies from the south to maintain the changes that have taken place in their culture.

The west coast of North Greenland was the ancient route extension of Eskimo habitation from Canada and Alaska. The Polar Eskimos have lived in the Thule District for centuries. They came into contact with the white man for the first time in 1818. Until that time they had considered themselves the only people in the world. Whalers and explorers visited them occasionally during the 19th century, and after 1909 Christianity and commerce brought them into permanent contact with Danes and West Greenlanders. Today the Polar Eskimo population is a genealogically mixed people, though to a lesser extent than the native people of the rest of Greenland.

Several researchers have inquired about relevant family data to assist in the interpretation of genetic and anthropometric information. The World Health Organisation has pointed out the need for health-related research among the rather isolated Arctic populations. Consequently it has become clear to the authors that the collection of family data among the Polar Eskimos, which was started in 1928, should be summarized and brought up to date. In connection with a visit among the Polar Eskimos in 1963 genealogical information as well as data on blood groups, fingerprints, color photos of eyes (LISBET and AAGE GILBERG, 1976), black-and-white pictures of faces, anthropometrical measurements (ROLF GILBERG et al., 1975), genetic markers, hair samples, and other relevant items, were secured.

The aim of this work is to define the family relationships among the Polar Eskimos as precisely as possible, using many kinds of sources in order to learn how this Eskimo group has been able to survive in isolation in the high Arctic environment for centuries without evident biologi-

cal degeneration. Only the information on the family relationships will be presented in this work.

The purpose of the genealogical register of the Polar Eskimos was (1) to indicate the ties of kinship among them, and (2) to find an unambiguous system for identification of each individual. A code system was developed which would not only place each of them in the correct relation among kinsfolk, but which would also identify without ambiguity the ancestors and descendants of all living persons.

These aims are combined in the form of the *Polar Eskimo Family Relationship Register*, in which all Polar Eskimos are organized by sibling groups. This register will not be published. For the purpose of this publication the register has been summarized on December 31, 1973; however, the work of collecting genealogical information on the Polar Eskimo population will continue.

Introduction

Collection of genealogical data

The first permanent physician among the Polar Eskimos was MOGENS HOLM, who was appointed by KNUD RASMUSSEN. DR. HOLM started in 1928 to collect genealogical information on that group to obtain some idea of the family relationships among the living population at that time. In HOLM's time the Polar Eskimos did not have surnames, thus he had difficulties in determining the immediate kinship ties among them. Because these relationships were important from a medical point of view, HOLM listed them by nuclear families. He continued his genealogical work until he left the area in 1937.

HOLM's *Polar Eskimo Family List* was very helpful to LISBET and AAGE GILBERG. AA. GILBERG worked as a physician among the Polar Eskimos in 1938-1939. Through personal contact with Polar Eskimos and administration employees, the GILBERG's were able to collect genealogical information on the group both at the time of their sojourn and over the years after they left the area. During a three-month visit to the Thule District in the summer of 1963 the GILBERG's were able to validate the family data collected after 1939 as well as to bring the list up to date. Family data were collected not only among the living, but also for the deceased. This work was based on many different kinds of sources.

In 1963 the genealogical work team was enlarged by ROLF GILBERG. The latter has been in charge of the genealogical data collection between 1963 and 1973 aided by a three-month visit to the Polar Eskimos in the summer of 1969.

Through the teamwork of the four authors the genealogical information on the Polar Eskimos has been increased both for past and present families to the extent that the span of data in some families covers 6 or 7 generations.

Origin of Polar Eskimo family data

The main source of genealogical information has been the Polar Eskimos themselves. HOLM started by asking them who was related to whom. He obtained important information on the population as it was before his arrival by talking to the elders, the manager of the trading post and the minister. Direct interviewing has also been used by each member of the work team as the principal means of gaining information throughout the whole course of the study and this has provided the bulk of the data.

To the Polar Eskimo's own contribution is added what could be learned from numerous administrative documentary sources and expedition reports, as follows:

- (1) The Church Register for the church at Thule (founded in 1909). Polar Eskimo entries were first made in 1912. Only christened Polar Eskimos were found listed in the Church Register. After 1934, when the last adult baptism took place, all Polar Eskimos were registered in the Church Register.
- (2) The Hunters' Council Reports. The Council was established by KNUD RASMUSSEN in 1928 and consisted of six members: Three *ex officio* (the manager of the trading post, the physician, the minister) and three chosen Polar Eskimo hunters. In 1963 the Hunters' Council was replaced by an elected municipal council.
- (3) Medical case reports from the hospital of the Thule District. The hospital was built in 1928–1929 at Ũmánaq (now Dundas). A larger and more modern hospital replaced it when the administration town, Thule, moved to the settlement at Qânâq in 1954.
- (4) The midwife journal of the Thule District (since 1927).
- (6) The Thule District Medical Year Report (since 1929).
- (6) Designation lists made by the minister in Thule.
- (7) The lists of purchase from the Polar Eskimos by the Thule Trading Station.
- (8) Explorers' diaries and expedition reports. Especially unpublished papers of KNUD RASMUSSEN, PETER FREUCHEN, LUDVIG MYLIUS-ERICHSEN, FREDERICK A. COOK, ROBERT E. PEARY and HUGH LEE.
- (9) The huge amount of literature published on the Polar Eskimos (bibliography, see ROLF GILBERG, 1976).

Method

When a Polar Eskimo died in pre-Christian times, his or her name became taboo, and was never mentioned again until it could be given to a newborn baby. Any other Polar Eskimo bearing the abandoned name had to assume an alternate of his or her names until a baby was given the name. Sometimes a Polar Eskimo would keep the new name and not resume the old one. This custom, which is still used among the Polar Eskimos without the former religious connotations, is the reason why it is necessary to use an identity code.

In the 1950s the Ministry of Ecclesiastical Affairs established family names among the Polar Eskimos. (For details on Polar Eskimos names, see ROLF GILBERG, in preparation).

Because the complete genealogy contains much information of a private character on the Polar Eskimos, both living and dead, we have decided not to publish their names in order to preserve confidentiality. For the same reason we also leave out the day in all dates (upon the request of the Ministry of Ecclesiastical Affairs), but when the whole date is known, we mark the entry with a dot. In the Family Ancestor Diagram a box is reserved for the marriage date. We also omit this information in the published work on account of its very private character, but it is present in the basic data.

These precautions have been taken in compliance with the conditions under which we received permission from the Ministry of Ecclesiastical Affairs to obtain information from the Church Register. The conditions specified were (1) that examination of the Church Register take place in the home of the minister and under his supervision and (2) that no information be given to a third party which might hurt living Polar Eskimos or diminish the respect in which they are held by their fellow citizens.

In a work of this type, errors and missing information can hardly be avoided, especially concerning persons who died a long time ago. We have done all we could to keep the level of errors as low as possible. We are also aware that new evidence in some cases will enable corrections to be made; therefore, we shall always be happy to receive supplementary information that will lead to corrections or improvements, since we desire that this Polar Eskimo genealogy may be as precise and accurate as possible.

A demographical work of this kind can never be ended, because it describes conditions in a population which is in constant change. Our hope is that this work may be continued along the lines which we have started. We also hope that this accumulation of family data will be of value to the Polar Eskimos themselves and to all mankind as an example

of how a small population living under severe environmental conditions has adopted itself to a changing world.

Storing of Polar Eskimo genealogical data

The work team has developed a *Family Ancestor Diagram* (figure p. 9) for the storing of genealogical information. This diagram has proved to be a convenient way of storing the information.

The code to the diagram will be explained later in the text; given here are remarks on the structure of the Family Ancestor Diagram: Social organization in Eskimo society is built around the family; therefore, the central feature of our Family Ancestor Diagram is the nuclear family consisting of the father, mother, and the children. In the center of the diagram are blank spaces for the children. The mother is placed to the right and the father to the left of this space. For each of these there are boxes containing information on dates of birth and death, for names, and for matings. The boxes have sharp corners for males and rounded corners for females. The ancestors of the children are marked with a small *ancestor number* based on the ROLLER System (FABRITIUS & HATT, 1963: 46) over the box for their identity code, which is explained later in the text. The ancestor numbers start with the father as number 1, the mother as No. 2, the father's father as No. 3, the father's mother as No. 4, the mother's father as No. 5, the mother's mother as No. 6, etc.

When an ancestor number is needed for a person of a higher generation it can be calculated for the parents to a person with ancestor number N by using the formular $(2N + 1)$ for the father and $(2N + 2)$ for the mother. For example, if a person has ancestor number 15, his father will have ancestor number $(2 \times 15 + 1)$ or 31; and his mother is $(2 \times 15 + 2)$ or 32, as shown in the Family Ancestor Diagram. In this way all males have an uneven ancestor number and the females an even ancestor-number. Ancestor numbers belonging to the left half of the diagram (*viz.* for ancestors of both sexes starting from the father with ancestor number 1) are underlined.

The Family Ancestor Diagram has, in addition to the children's generation, five ancestor generations marked; the ancestors are horizontally divided into a parents' generation [ancestor generation number one ($n = 1$)], a grandparents' generation ($n = 2$), a great-grandparents' generation ($n = 3$), etc.

For practical and ethical reasons (the names of persons, see method) we have chosen not to publish the genealogical data presented in the way they are registered in the Family Ancestor Diagram, but in a shorter form in a smaller part of the diagram, the *Extended Family Diagram* (see foldout page). The genealogical information and the code system is the same in the two diagrams. The main difference is the absence of names in the Extended Family Diagrams.

Definition of the Polar Eskimo population

The word 'population' is often used in two different ways. One meaning is 'people'. This includes all members, the living and the dead. With respect to the Polar Eskimos, all members of the population are

Notes:

notes

Notes:

found in the genealogical diagrams of this work, as far back as they are known.

Another meaning of the term 'population' is 'size'; that is, the number of living members in a census on a given date. For the Polar Eskimos the census can be counted on two, slightly different, bases: (1) The total Polar Eskimo population, that is, all Polar Eskimos alive on the census day no matter where they live. (2) the local Polar Eskimo population, that is, all Polar Eskimos alive and resident in the Thule District, but also including those temporarily living in either West Greenland or Denmark.

Geographically the Thule District is a well-defined area between Humboldt Gletscher, the Inland Ice, Melville Bugt and Smith Sound, and can be considered an isolated "island" in a "sea" of ice.

The Eskimo population living on this "island" at any time could be considered the Polar Eskimo population. Such a definition would have given a correct picture of the situation before the year 1818, after which foreigners began to visit the land of the Polar Eskimos. Because the Eskimo population in the Thule District prior to 1818 had been totally isolated for some 100 to 200 years, we take that population of genuine Polar Eskimos as forming a breeding isolate. The members of this breeding isolate has two main things in common: (1) they were residents within the geographical boundaries of the Thule District and (2) they were genetically connected, forming together the Polar Eskimo gene pool.

Today different ethnic groups live in the Thule District; however, most of them do not belong to the Polar Eskimo gene pool. Excluded are: The crew of the Thule Air Base, members of scientific expeditions, Danish and West Greenland employees in the administration, and West Greenland hunter families; unless, of course, they have genetic ties to the Polar Eskimo people.

As the Polar Eskimo population we then understand the descendants of the breeding isolate prior to 1818 in the Thule District who form a gene pool including the foreigners who have donated to it.

Thus the Polar Eskimo population consists of the following sub-groups:

- (I) Genuine Polar Eskimos: these are Polar Eskimos about whom we have no records of non-Polar Eskimo ancestors.
- (II) Mixed Polar Eskimos: these are Polar Eskimos who have among their ancestors known non-Polar Eskimos.
- (III) Non-Polar Eskimo members of the Polar Eskimo population: these are members of the Polar Eskimo breeding isolate linked either through a child or a legal marriage. Thus, it is only the non-Polar Eskimo parent or spouse who belongs to the

Polar Eskimo breeding isolate. His or her ancestors, siblings, or other kinsfolk are not considered members of the population. Practical reasons turn these into four groups: (for details see pages 14-15):

- (1) Canada Eskimo immigrants from Baffin Island of the 1860s.
- (2) West Greenlanders.
- (3) Whites.
- (4) Blacks.

The official census for the Thule District gives a population size that includes all human beings resident there, except, however, the Thule Air Base personnel. The official census does not recognize the Polar Eskimo population as an entity, but divides the total number of residents in the Thule District into those "born in Greenland" and those "born outside of Greenland". (For details on census see ROLF GILBERG, 1976).

Polar Eskimo Register (the code system)

In Eskimo society the family is the basic unit of social organization, therefore, the register is based upon the nuclear family as a biological unit.

Extended Family Diagram (see foldout page)

This diagram is built up from the bottom with a ten-box system for ten children. For each child there are four vertical boxes containing information on: (1) succession in sib group, (2) birth date, (3) death data, (4) number of matings (space for five) indicated by family numbers.

Above the box system for children there are spaces for the parents, the father to the left and the mother to the right, both with boxes for birth date, death date, and matings. Between the parents is placed the family number. Above the parents is placed horizontally the grandparents' generation, and above them the great-grandparents' generation. On top of the diagram the ancestor index is placed. In the register the rule is that when a box is empty we have no information on the subject.

Mating

In Polar Eskimo genealogy the term 'mating' is used both (1) for a marriage — regardless of whether it was a church or civil ceremony — as long as the spouses live together whether they have children or not, and (2) for a sexual union resulting in a child. The actual mating is marked by a hyphen in the mating box and not by family number as is usually the case in the chronological order.

In some cases knowledge of a mating exists without further information being given on spouses or children. In such cases the mating is marked in the mating-box in the correct order, not by the customary family number, but by an open square. Similarly the open square is used to show other matings for non-Polar Eskimos of a type that do not influence the Polar Eskimo genealogy.

Family Number

All matings are given a family number. To make the system open-ended in both directions, three types of family numbers are applied:

- (1) Present: a three-figure number (001, 002, 003, 004, . . . etc). This type of family number is given to all living Polar Eskimo families for whom the genealogy was started in the late 1920s.
- (2) Past: a double letter number (aa, ab, ac, ad, . . . ay, az, ba, bb, bc, . . . etc.), As first letter in the pair 'l' and 'o' are omitted to avoid confusion with numerals. This type of family number is given to the Polar Eskimo families in the 19th century and in the first two decades of the 20th century.
- (3) The double letter number is applied also to non-Polar Eskimo families by using the last part of the alphabet (zz, zy, zx, . . . zb, za, yz, yy, . . . etc.).

Children

Children are the center of an Eskimo family; therefore, they are placed in the center of the diagram. They are marked by a capital letter according to order of birth, with an 'A' for the first born, a 'B' for the second, a 'C' for the third, etc. To avoid confusion with figures, 'I' and 'O' are not used in the sib group. This A, B, C, . . . marking of siblings is called an *A-sib group* and is used only when there is complete information on the number of siblings and the correct age succession.

In cases where there is insufficient information on the exact number of siblings and on the order in which they are born, another capital letter series (U, V, W, X, Y, Z, U', V', W', X', Y', Z') is used. This series is called a *U-sib group*. In a U-sib group there might not be a chronological age succession corresponding to the order of the capital letters.

In the Extended Family Diagram the sib groups do not always start in the first box from the left as is usual. The number of empty boxes in front of the sib group indicate the minimum number of children the mother of the family in question had in earlier matings.

If a diagram lacks sufficient room to the right for the placing of the entire sib group, an arrow pointing to the right indicates that the sib group continues in the next diagram with the same family number.

Sex

The sex of a child is indicated by underlining the capital letter for a male: A, B, . . . and not underlining the capital letter for a female: A, B, . . . Unknown sex is shown by two dots below the capital letter: A, B, . . . Twins are marked by inverted brackets in front of the capital letter:)(A,)(B, . . .

Where there is knowledge of an abortion it is placed in the chronological letter and age succession. In this way the sib group shows the

number of pregnancies as far as they are known. But we must point out that many cases of abortions have occurred without record.

Identity code

This is the most important feature in the register. The identity code is composed of the family number with the sib group capital letter immediately in front: A001, which reads: the first child, a male, in the mating having family number 001. Each Polar Eskimo gets his or her own identity code different from any others! Without information on the name of a person or on birth or death dates, the identity code places the person unambiguously among kinsfolk.

In the diagrams the children's ancestors are represented by their identity code. These ancestors, beginning with the parents, then the grandparents, then the great-grandparents, are placed in horizontal lines above their children.

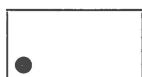

A small arrow pointing upwards from the box of a great-grandparent indicates knowledge of more ancestors. As there is no room in the diagram, one has to look at another diagram: the identity code of the person just below the arrow shows by means of the family number to which family diagram the reader should turn.

Ancestor Code

In some cases it may be useful in addition to the identity code to use an *Ancestor Code*, built up of the ancestor number, an oblique line, and the family number.

Non-Polar Eskimos

Non-Polar Eskimos of both sexes are marked by a dot in the corner of the identity code box as follows:

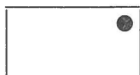

Canada Eskimo immigrants from Baffin Island of the 1860s. These immigrants are in the remaining text abbreviated to 'Canada Eskimos' or to (C). It is unknown whether they mixed with other groups (such as Eskimos, Indians or Whites) in Canada before coming to the Thule District. One of them, QUMANGÂPIK, came from as far south as Southampton Island; the rest came from Arctic Bay (ROLF GILBERG, 1975).

The Canada Eskimo and the genuine Polar Eskimos are considered to have a common origin in the past and are, therefore, in most investigations grouped together in one and the same category.

West Greenlanders (G). The first member of this category was HANS HENDRIK, who married a Polar Eskimo in the 1850s. Since 1909 approximately 50 West Greenlanders, in most cases females, have married into the Polar Eskimo breeding isolate.

During the past 250 years the West Greenland population has turned into a somewhat mixed, mostly Eskimo-Danish, population.

Whites (E). Mostly Danes, but in some cases others such as, for instance, European whalers and members of scientific expeditions (especially American expeditions).

Blacks (N). Only one person belongs in this category (MATTHEW HENSON, an American Black).

Unknown. This person is presumably a non-Polar Eskimo, but might on the other hand also be a mixed or a genuine Polar Eskimo. We do not know the identity of the person at present. This symbol appears only in matings with a three-figure family number.

Unknown persons are not given an identity code.

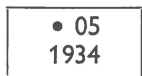

In matings with a double letter family number, the information on the ancestors ceases at some point; in these cases the identity code box is simply just left blank.

The 'unknown mark' is not and must not be used in those cases.

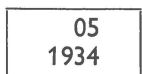

In a written text the origin of a non-Polar Eskimo is indicated by placing the non-Polar Eskimo symbols (C), (G), (E), or (N) (*viz*, a capital letter in brackets) immediately in front of the identity code.

Dates of birth and death

For each child and parent the dates of birth and death are given if known. For persons in the older part of the genealogy, exact dates have been impossible to find. In these cases an approximate date is given, following the system shown below:

reads: May 1934; the day is known, but not given in accord with the request of the Ministry of Ecclesiastical Affairs. A known day is indicated by a dot.

reads: May 1934. (day unknown).

reads: 1934. (month and day unknown).

95- 1897	reads: between 1895 and 1897, both years inclusive.
c 1892	reads: approximately 1892, meaning 1892 plus or minus two years, or a five year period from 1890 to 1894, both years inclusive.
cc 1892	reads: more approximately 1892, meaning 1892 plus or minus five years, or an eleven year period from 1887 to 1897, both years inclusive.
- 1875	reads 1875 or before.
e 1875	reads: 1875 or later.

In some cases the month is not known, only the season of the year. Winter (V) in the Thule District is the dark period, the polar night, without any sun from late October to the middle of February. Spring (F) is a two-month period with night and day, the day rapidly growing longer and longer. Summer (S) is the time of constant sun all 24 hours from late April to the middle of August. Fall (E) is the two months before the dark period, where day and night are changing, the night becoming longer and longer.

S 1875	reads: summer 1875.
SE 1875	reads: summer 1875 and fall 1875, inclusive.
S87- 1888	reads: from summer 1877 through 1888, inclusive.
87-S 1888	reads: from 1887 through summer 1888, inclusive.
87V 1888	reads: the winter between 1887 and 1888.
E92S 1893	reads: from fall 1892 through summer 1893, inclusive.
c90F 1893	reads: approximately 1890 ± 2 years through spring 1893, inclusive.

Places of birth and death

For the Polar Eskimos the most natural birth place and death place is a settlement in the Thule District, and for a non-Polar Eskimo the natural birth place and death place is outside the Thule District. When the distribution of birthplaces and death places follow this pattern, nothing is marked in the box for birth date and death date.

However, if a genuine or a mixed Polar Eskimo is born outside the Thule District, this event is marked by a small open triangle pointing downwards in the birth date box. Similarly, a death outside the district is marked in the death date box. When a non-Polar Eskimo is born or dies within the Thule District the same open triangle is applied in the same way.

Code for deaths of children

Children dying before the age of 15 years are divided into three groups by the following symbols:

+++ reads: stillborn
or dead within the first week of life.

++ reads: dead after the first week of life
but within the first year of life.

+ reads: dead after the first year of life
but before the age of 15 years.

When information on the age of death of a child is incomplete, alternative death symbols are used as follows:

--- = +++/++ reads: stillborn or dead as a child
(within the first year of life)

--- = +++/++/+ reads: stillborn or dead as a child
(before the age of 15 years)

--- = +++/++/+/ dead 15 years old or older
reads: stillborn or dead as a child or as an adult

-- = ++/+ reads: dead as a child
(after the first week of life)

-- = ++/+/ dead 15 years old or older
reads: dead as a child (after the first week of life) or as an adult.

- = +/ dead 15 years old or older
reads: dead as a child (after the first year of life) or as an adult.

The death symbols are placed in the Extended Family Diagrams in the first mating box of the child in question, as there is no use for family number(s).

In case of an abortion a black square is placed in the first mating box instead of a death symbol.

Classification of the Polar Eskimo Family Sib Group Size

For each mating the number of children is indicated by a figure, the sib group size, in the upper right corner of the Extended Family Diagram.

The conditions under which the genealogical data have been collected, especially concerning the time before 1928, and the fact that information only runs to December 31, 1973, may in some matings influence the definitive number of siblings. This is, therefore, given with various degrees of certainty. These circumstances may be of importance when one would like to find out the total number of children a woman has born.

Using sib group size

The following six classifications of certainty have been applied; the degree of certainty decreases towards the right:

Categories	I	II	III	IV	V	VI
Examples of sib group size four	4	.4	'4	'4	"4	''1

Comments on categories:

- (I) Category without any marking. A-sib group where the mating is terminated through (1) the death or sterilization of one or both parents, or (2) the departure of one of the parents from the Thule District, or (3) divorce, or (4) a new mating of one or both parents.

When childless mating ('knowledge of no children') occurs, the sib group belongs likewise to an A-sib group category, and the case is a sib group size zero (0).

In this category the sib group size is well documented and furnishes exact information when used in calculating the total number of children a mother has born.

- (II) Marked by a low dot. A-sib group where the mating continues after December 31, 1973, and the mother is born in or before 1923; so that by December 31, 1973, she is at least 50 years old.

In instances of childless mating, the case is a sib group size .0; in this category the sib group size has so low a degree of uncertainty that it might safely be put together with category (I).

- (III) Marked by a high dot. A-sib group where the mating continues after December 31, 1973, and the mother is born in or after 1924, so that by December 31, 1973, she is younger than 50 years old, and her last child is born in or before 1963. Thus ten or more years have past prior to December 31, 1973, since birth of the last child or an abortion has occurred. (The period of ten years is arbitrarily chosen — here and in the following lines).

If in childless mating, the spouses have lived together for ten years or more, then the case is a sib group size '0; in this category the sib group size has so low a degree of uncertainty that it might safely be put with together with category (I) and (II).

- (IV) Marked by an apostrophe. A-sib group where the mating continues after December 31, 1973, and the mother is born in or after 1924, so that by December 31, 1973, she is younger than 50 years old. Her last child is born in or after 1964. Thus less than ten years have past prior to December 31, 1973, since the birth of her last child or an abortion has occurred.

If in childless mating, the spouses have lived together for less than ten years, then the case is a sib group size '0. Newly married couples fall into this category.

In this category the sib group size always has some degree of uncertainty.

- (V) Marked by a double apostroph. U-sib groups. If there is 'no knowledge of children' the sib group belongs to a U-sib group category, and the case is a sib group size "0.

In this category the sib group size number must be considered as a minimum, inasmuch as the real number of children or abortions might have been larger, but we do not have sufficient information on how much larger.

- (VI) For the last two decades several sexual unions without family character have resulted in a child. These sib group sizes have been difficult to place in the sib group system, because there exists uncertainty as to the length of the mating or as to whether the mating is terminated or not; sometimes the parents stay together and form a family, and at other times they are together only briefly. Many of these cases, though, will be placed in category (I), and others in category (IV).

Otherwise, cases that cannot be placed are put in a special category (VI), marked by a high double dot. This is often the case when the father is unknown; and usually there is only one child.

Ancestor Index

The Polar Eskimo ancestor index indicates among known ancestors the kind and degree of mixture with non-Polar Eskimos for the children in each nuclear family. The index gives an idea of how many ancestors out of one thousand are genuine Polar Eskimos. The index is calculated per one thousand ancestors using an approximated border value valid for an infinite number of ancestors.

The following formula is used in calculating the ancestor index, here more exactly named:

$$\text{Ancestor Index Total Value} = 1000 \div \sum (0.5)^n 1000$$

n = generation number for the latest born non-Polar Eskimo ancestor (or possible unknown ancestor)

$\sum$ = summation sign. Indicates that $(0.5)^n 1000$ must be calculated for each latest born non-Polar Eskimo ancestor or possible unknown ancestor, every time such an ancestor appears no matter if it is on the father's side or on the mother's side and independent of the non-Polar Eskimo category.

In calculating the Ancestor Index Total Value the 'Canada Eskimos' are, for the sake of convenience, here considered genuine Polar Eskimos, and thus do not influence the index result. However the value due to the 'Canada Eskimo' influence is calculated and given in the Ancestor Index Partial Values (see below), and the reader can, if so wanted, include the 'Canada Eskimo' value in calculating the Ancestor Index Total Value.

Ancestor Index Partial Values

In many cases the reader may be interested in knowing not only the Ancestor Index Total Value (a figure from near zero to 1000) which gives only the total degree of mixture, but may be interested in the kind of mixture as well. The degree for each kind of mixture of non-Polar Eskimo origin (including possible 'unknown' origin) is given in the five Ancestor Index Partial Values, used earlier in the calculation of the Ancestor Index Total Value.

Origin code

To supplement the degree and kind of data, information is given on how far back in generations the mixture took place, separately for the father's side and the mother's side, indicated by the origin code, in the shape of a double position code. In this code there are, for each

parent's side, four positions disposed for the four different kinds of non-Polar Eskimos, distributed as follows: first position for 'Canada Eskimo' (C), second position for West Greenlander (G), third position for White (E), fourth and last position for Black (N). For each of these four positions is given — either a figure representing the generation number for the most recently born non-Polar Eskimo of the particular category, — or a special sign: a hyphen or a dot.

In some cases there are, on the same side of the origin code: (1) more than one incidence, in the same or in a higher generation, of the latest born non-Polar Eskimo ancestor of the same non-Polar Eskimo category, and/or (2) further admixture among the ancestors of one or more of the non-Polar Eskimos mentioned in (1). — These cases will be disclosed by more specific study of the corresponding Extended Family Diagrams.

The origin code cannot record those facts, but in both cases a cross in a circle, $\otimes$, between the two parts of the origin code indicates that supplementary and necessary information is obtained by looking at the different ancestor index partial values, in the corresponding complete ancestor index code.

In cases without any mixture among the ancestors this is in the origin code marked by two sets of four hyphens.

A further understanding of the structure of the origin code may be helped by discussion of some examples.

Example (1): ---- ----

reads: on both the father's side and the mother's side the ancestors are genuine Polar Eskimos.

Example (2): 4--2 -23-

reads: on the father's side in ancestor generation number four is found a last born 'Canada Eskimo' and in generation number two a Black as the last born non-Polar Eskimo. On the mother's side in ancestor generation number two is found a West Greenlander, as the last born non-Polar Eskimo, and in generation number three a White. — The remaining ancestors are genuine Polar Eskimos, as indicated by hyphens.

Example (3): .1.. ----

reads: on the father's side in ancestor generation number one is found a West Greenlander (that is the father himself). All the ancestors on the father's side will of course be West Greenlanders. Dots, therefore, mark the position when there are no genuine Polar Eskimo ancestors among ancestors of the side in question. On the mother's side there is no known admixture with non-Polar Eskimos; this is indicated by four hyphens.

Example (4): ----

reads: the father is unknown, and the mother is a genuine Polar Eskimo.

Complete Ancestor Index Code

The Complete Ancestor Index Code consists of the *origin code*, the five *ancestor index partial values*, and the *ancestor index total value*, and is placed in the upper line of the Extended Family Diagram, separated from the sib group by an oblique line (see the foldout page).

Example (5):

4--2 -23- / 063 250 125 250 000 = 375 /

Reads: The origin code is the same as shown in example (2). The calculated ancestor index partial values for the four non-Polar Eskimos represented in the origin code are: 'Canada Eskimo': 063; West Greenlander: 250; White: 125; Black: 250. The ancestor index total value for the children in this mating is (since the 'Canada Eskimos' are left out): $1000 \div (250 + 125 + 250) = 1000 \div 625 = 375$ as written at the end of the line in the diagram.

Example (6):

. . . . -23- / "000 "125 "000 500 = "125 /

reads: unknown father (ancestor index partial value = 500). The mother's side is the same as in example (2) and (5). The calculated ancestor index partial values for the two non-Polar Eskimo and the unknown in the origin code are: West Greenlander: "250; White: "125; unknown: 500. The calculation of the ancestor index total value: $1000 \div "(250 + 125) \div 500 = 1000 \div "875 = "125$.

In cases like this where the father is unknown, the figure 500 of the ancestor index partial values are the unknown father's contribution to the construction of the ancestor index; the mentioned figure is a maximum figure, because the 'unknown' is presumably a non-Polar Eskimo but *might* be a mixed or a genuine Polar Eskimo. In consequence of this the remaining ancestor index partial values and the ancestor index total value may be minimum figures. To show this state of things a double apostrophe is placed in front of both the ancestor index total value, and the ancestor index partial values referring to non-Polar Eskimo ancestors.

Inbreeding among the Polar Eskimos

In pre-Christian times Polar Eskimos thought that marriage between cousins' would be bad for the society, resulting in poor hunting, bad weather, and other disasters. Before the Second World War, marriages

among relatives seemed to have been avoided at least up to the fourth cousin. Only a few marriages between cousins are known from that time. This has changed in the last two decades when 36 cases of marriage between cousins have been recorded.

Inbreeding coefficient

The inbreeding coefficient F is calculated for each nuclear family in relation to the children's generation by using a slightly modified form of the Sewall Wright formula (ALBERTSEN, 1968; WRIGHT, 1922):

$$F = \sum (0.5)^{n_f + n_m - 1} (1 + F_A)$$

A = latest born ancestor common for the parents in the nuclear family

n_f = ancestor generation number for A on the father's side.

n_m = ancestor generation number for A on the mother's side.

F_A = possible inbreeding coefficient for the common ancestor A (F_A was zero in all 69 Polar Eskimo cases shown below).

Σ = summation sign, shows that calculation of F must be done for each (latest born) ancestor in common found on the father's side and found on the mother's side, and all these calculations are then added.

In calculation of F	n $(0.5)^n$:
the calculated values of	1 0.50000
$(0.5)^n$ are shown here:	2 0.25000
	3 0.12500
	4 0.06250
	5 0.03125
	6 0.01563
	7 0.00781
	8 0.00391
	9 0.00195
	10 0.00098

To get an idea of how the value of the inbreeding coefficient is related to kinship among the parents in the nuclear family, the inbreeding coefficient is calculated for the following kinship relations: Uncle-niece: $F = 0.1250$; Aunt-nephew: $F = 0.1250$; First cousins: $F = 0.0625$; Second cousins: $F = 0.0156$; No kinship between the parents at all: $F = \text{zero}$.

The calculated inbreeding coefficient, given to four decimals, is shown in the Extended Family Diagram in the box just above the family number.

Table of common ancestors in 69 Polar Eskimo matings

The matings in question are organized by family number. Matings not mentioned have an inbreeding coefficient of zero. For each inbreeding coefficient is given the common ancestors indicated by their ancestor-number (explained on page 8 and in figure 1). When both spouses are involved as common ancestors two ancestor-numbers, separated by a dot, are given. Two identical couples or single person of common ancestors are separated by a parenthesis indicating the generation number in which the common ancestors appear. When the common ancestors are not found in the same generation on both sides, both generation numbers are given in the parenthesis, separated by an oblique line, the left showing the generation number on the father's side, the right on the mother's side.

An example will serve to clarify: 028 0.0313 15.16 (4/3) 11.12 which reads: in mating having family number 028 the inbreeding coefficient is calculated to 0.0313. The couple with ancestor numbers 15 and 16 on the father's side in generation number four is identical with the couple on the mother's side in generation number three with ancestor numbers 11 and 12. Or in other words, the great-grandparents (11.12) on the mother's side of the Polar Eskimo, A 028, are identical with the great-great-grandparents (15.16) on the father's side.

Of the 69 matings shown below, seven were childless: 037, 112, 132, 186, 331, ia, ic. In three matings the common ancestors were totally or partly the result of West Greenlandic ancestors: 175, 197, 257.

Acknowledgements

Any person who has lived among the Polar Eskimos and studied them for a long time can hardly avoid being strongly fascinated by their special way of life and customs. An intimate knowledge of this isolated ethnic group was the force which induced the authors to study Polar Eskimo society. This study, however, could never have been made without the kind and understanding help of the Polar Eskimos themselves. We are very grateful to them for letting us look into their private lives and for their friendship and trust.

The Ministry of Ecclesiastical Affairs in Copenhagen kindly granted us permission to examine the Church Register at Thule Church. The Greenland Ministry in Copenhagen showed great understanding for our work and gave us permission to study archivalia. The Royal Library, the National Archives, and the Arctic Institute, all in Copenhagen, provided valuable assistance in the search for information on the Polar Eskimos. The Polar Section of the National Archives of the U.S.A. and the National Geographic Society, both in Washington, D.C., helped us to gain access to papers of the Peary North Greenland Expeditions and to extract information from the files during a visit in 1972.

The Institutes of Forensic Medicine at both the University of Copenhagen and the University of Århus provided through their interest in our work inspiration and help in planning the collection of the genetic data. Chief physician KAI ALBERTSEN provided guidance in calculating the inbreeding coefficient. The Danish State Research Foundation made the trip to Greenland in 1963 and 1969 possible by furnishing travel grants. Dr. FRED A. MILAN and Dr. KARL REINHARD made valuable suggestions in the process of improving the readability of the English text. To all these Institutions and persons, we extend our heartfelt thanks.

All communications may be send to ROLF GILBERG, Department of Ethnography, National Museum of Denmark, Ny Vestergade 10, DK - 1471 Copenhagen K, Denmark.

[illegible]

[illegible][illegible]

$..1. 32-- / 125 250 500 000 000 = 250 / ^*3$

The grid contains the following elements:

- Top row: $..1. 32-- / 125 250 500 000 000 = 250 / ^*3$
- Row 2: Four empty boxes, followed by $\sqrt{cv}$ and Ucd , followed by two empty boxes with dots.
- Row 3: Four empty boxes, followed by $\underline{U} 065$, followed by an empty box with a dot and Uwo .
- Row 4: A box with a minus sign, $\underline{U}zg$ with a dot, a large box with **216**, $D068$, and a box with a minus sign.
- Row 5: A box with $\cdot 01$ and **1921**, a large empty box, a box with $\cdot 05$ and **1933**, and a large empty box.
- Row 6: A header row for a table with columns **A**, **B**, **C**, and three empty boxes.
- Row 7: A table row with $\forall 05$ and **1950**, $\forall 09$ and **1951**, $\forall 09$ and **1955**, and an empty box.
- Row 8: A row of five empty boxes.
- Row 9: A row of five empty boxes.
- Row 10: A row of five empty boxes.
- Row 11: A row of five empty boxes.
- Row 12: A row of five empty boxes.
- Row 13: A row of five empty boxes.
- Row 14: A row of five empty boxes.
- Row 15: A row of five empty boxes.
- Row 16: A row of five empty boxes.
- Row 17: A row of five empty boxes.
- Row 18: A row of five empty boxes.
- Row 19: A row of five empty boxes.
- Row 20: A row of five empty boxes.
- Row 21: A row of five empty boxes.
- Row 22: A row of five empty boxes.
- Row 23: A row of five empty boxes.
- Row 24: A row of five empty boxes.
- Row 25: A row of five empty boxes.
- Row 26: A row of five empty boxes.
- Row 27: A row of five empty boxes.

APPENDICES

POLAR ESKIMO GENETICAL AND
ANTHROPOLOGICAL MARKERS

Appendix A

Polar Eskimo Blood Group Data

by Aage Gilberg and Hans Gürtler

During a visit to the Thule District in North Greenland in the summer of 1963 (May–August) blood samples contained in two ten mililitertest tubes were obtained from each of 304 Polar Eskimos age 10 or above by August 1, 1963.

Collecting blood samples

The hospital in Qânâq, where Aage Gilberg was a resident physician during that period, served as the base for the collecting of samples. Furthermore, all the settlements in the district were visited by dog sled, motorboat, or by a halicopter kindly provided by the US Air Force from the Thule Air Base. Because most Polar Eskimos are hunters, many were not found at home, therefore, the optimal number of blood samples could not be obtained, even through some settlements were visited twice. However, some of the missing persons travelled great distances to Qânâq to participate in the investigation. On the return to Denmark by ship a few additional blood samples were obtained from Polar Eskimos living in West Greenland, either because they were hospitalized there or because they were attending school. Finally blood samples were obtained from a small number of Polar Eskimos living in Denmark. In this way it was possible to obtain blood samples from 94% of the optimal group, which was 301 persons (142 females + 159 males) in the Thule District; 10 persons (5 females + 5 males) in West Greenland; and 14 persons (10 females + 4 males) in Denmark. Had not the Polar Eskimos themselves given the investigation such understanding and close cooperation, the result would not have been so gratifying and so nearly complete.

Transporting blood samples

It was a considerable technical and logistical problem to transport the blood samples to Copenhagen in undamaged condition, above all because they must not be exposed to temperatures below freezing. Hence

they must not by mistake be packed in the outer storage areas of an airplane, where they would freeze and be rendered useless for the purpose of blood type testing. There were no published scientific instructions concerning the proper means of transporting blood safely in an Arctic climate.

The average temperature on a collection trip was $\div 15^{\circ}\text{C}$. When such a sled journey covered only short distance and when only a few samples had been collected, blood sample tubes were carried like a cartridgebelt and were maintained at safe temperatures inside polar bear skin trousers. In other cases, the tubes were placed in a wooden box lined with a 10 cm layer of glass wool. Inside the box the temperature was kept above freezing by several Japanese pocket heaters (really intended for sports fishermen in winter time).

By incandescent mantle these heaters would maintain the temperature for 24 hours. Every night while travelling, the pocket heaters were refuelled.

From the hospital in Qânâq, the blood samples, properly packed, were given directly to the U.S. Air Force helicopter pilot, who when weather conditions were favorable and the need arose flew the Thule Air Base — Qânâq route. When the pilot was about to leave Qânâq with the blood samples in his personal care, the time of departure was telegraphed to the Thule Air Base, to the Søndre Strømfjord Airport, and to Copenhagen. At the Thule Air Base the Danish liaison officer would meet the helicopter and take the samples by car to the base hospital where they would be kept at $+4^{\circ}\text{C}$ until they could be shipped further southwards on a military plane.

There the same procedure was used: the head of the Søndre Strømfjord Airport would keep the blood safe until it could be delivered to the SAS pilot on the regular scheduled flight to Copenhagen. In Copenhagen a car from the Forensic Institute of the University would meet the plane and bring the blood samples safely to the institute, which wanted shipment on a weekly basis.

This demanding and exciting program could not have been carried out without the kindness and understanding of all persons involved. All blood samples arrived in Copenhagen in good condition. Only once — in spite of all precautions — did a delivery of blood samples nearly get lost: at the Thule Air Base samples were mistakenly placed on a plane to Washington, D.C., instead of to Søndre Strømfjord. However, when the Strømfjord head of that airport did not receive them, he asked his wireless operator to trace the packet. When they were located on the Washington plane, he gave instructions on proper keeping conditions and on the fastest means of transportation to Copenhagen. They arrived safely.

Preparing of data

The analysis of the blood samples was carried out at the Forensic Institute at the University of Copenhagen under the supervision of Hans Gürtler.

After the blood samples are typed (paper in preparation) and tested for erythrocyte enzymes (DISSING et al., 1971) and serum type (GILBERG et al., 1967; NIELSEN et al., 1971; PERSSON et al., 1971), most of the samples are kept at the institute as a blood depot. This depot may be placed at the disposal of interested researchers by contacting the authors of this appendix.

From such a blood depot, additional information can be brought to light, for example about immunity from trichinosis, toxoplasmosis, and influenza; information on the affinity of the Polar Eskimos to rheumatism; and information on the effect that a special fat- and protein-rich diet may have on serum-free sebatic acid and serum-cholesterol.

Results

Most of the results will be found in table 1, pp. 148–161. In addition, it was found that genuine Polar Eskimos (see p. 10) had a high frequency of blood type O and low A_1 -gene frequency. The A_2 -gene, B-gene, rhesus-gene r, and K-gene were not found in that group. The genes A_2 , r, and K are of clear European origin. The Polar Eskimos have a higher frequency of N-gene than the inhabitants of West Greenland where the N-gene frequency is relatively low.

Concerning serum type Gm: "Chromosomes determining Gm(x), (f), and (b^1), present in other Mongoloid and in Caucasian populations, are absent in Greenland Eskimos free of European admixture. In the individuals of exclusively Polar Eskimo descent only two phenotypes occurred: Gm(a+x-f- b^0 - b^1 -s- b^3 -) and Gm(a+x-f- b^0 - b^1 -s+ b^3 +)"'. (NIELSEN et al., 1971: 406, 409).

With respect to the erythrocyte enzymes, the PGM₁²-gene frequency was very low among the Polar Eskimos, especially the genuine Polar Eskimos. Similar low gene frequency has been found among Alaskan Indians, while the PGM₁²-gene is common in East Greenland. The AK²-gene was not found among the Polar Eskimos. The investigation found a hitherto undescribed phenotype in four members of the same West Greenland family. The PGD^B-gene and the ADA²-gene were not found among genuine Polar Eskimos, but occurred in mixed Polar Eskimos.

Acknowledgements

We gratefully acknowledge the assistance of who assisted at the Thule Air Base, at SAS, and at the laboratories in Copenhagen.

Appendix B

Polar Eskimo Finger- and Palmprint Data

by C. H. Vogelius Andersen and Lisbet Gilberg

During a visit to the Thule District in North Greenland in the summer of 1963 (May–August) finger- and palmprints were obtained from 295 Polar Eskimos age 10 or above. This represents 91 % of the optimal group.

Collecting of data

Finger- and palmprints were collected by LISBET GILBERG according to the instruction of chief police inspector C. H. VOGELIUS ANDERSEN in his book on personal identification (1958) and in a special course given at police headquarters in Copenhagen for the purpose of this investigation.

Only a few implements were used in the field. Figure 1 shows the type of diagram employed. After the hands had been cleaned, the fingers were blackened one by one with a thin layer of ink on a glass plate. The inked finger was rolled in the appropriate place on the paper. An extra set of fingerprints using all fingers at once was taken as a control to ensure that the fingerprints had been placed in the right order.

In order to keep the fingerprint and palmprint together, the palmprint was taken on the back of the fingerprint paper (figure 2). The whole palm was inked with a roller. The paper was placed over a bottle, and first the fingertips were put on the paper, then the whole hand was rolled over the paper. This method gave clear prints.

As might be expected, hardworking housewives and active hunters gave the most unsatisfactory prints, because their finger surfaces were so worn that the skin could not reproduce the pattern.

Working up data

The finger- and palmprint of the Polar Eskimos were studied by C. H. VOGELIUS ANDERSEN. His results are shown below for each Polar Eskimo.

UNIVERSITETETS
RETSMEDICINSKE INSTITUT

Vittus Qissuk born: 05-03-1946

A 162

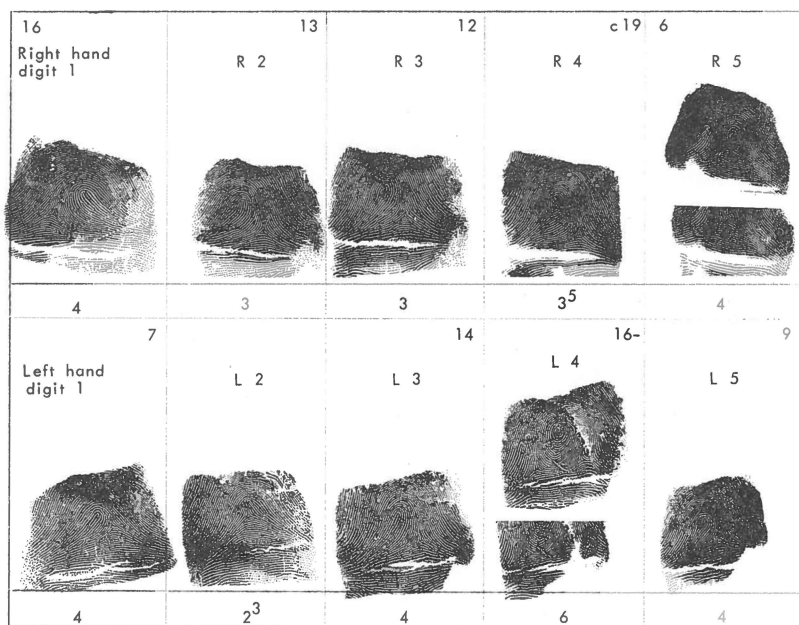

Fig. 1.

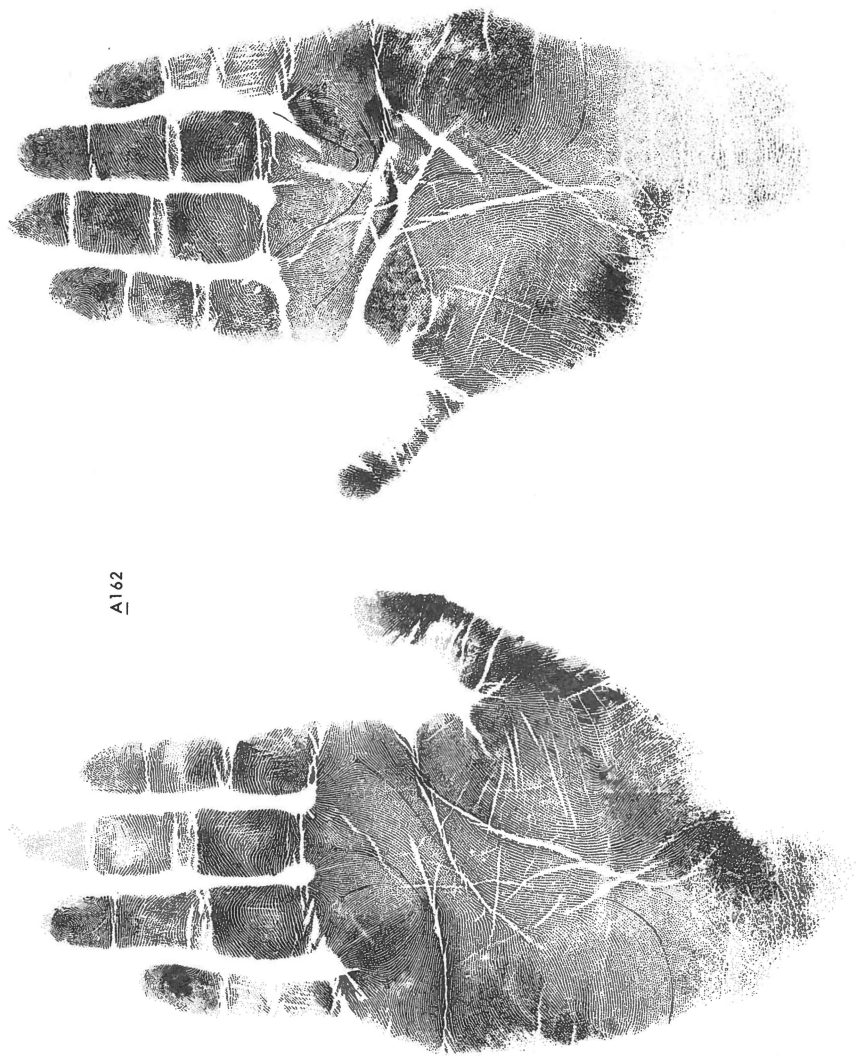

Fig. 2.

Polar Eskimo Fingerprints (table 2, pp. 162-175):

First the lefthand fingers are listed (the thumb as no 1), then the righthand fingers. The explanation of the symbols is:

Non-whorl patterns:

- 1: arches
- 2: tented arches
- 3: radial loops
- 4: ulnar loops

Whorl patterns:

- 5: central pockets
- 6: circular whorls
- 7: elliptical whorls
- 8: twin loops (TL)
- 9: composite patterns (Ac)

In the description of the digital pattern types, the presence of an exponent indicates various things: In many cases the exponent indicates a similarity to another type than the one given as the main type (for instance: 3⁵, 6⁷, 7⁸). But there are certain exceptions to this rule:

- (a) The exponents 3 or 4 at 1- or 2-patterns indicate that these patterns show a radial or an ulnar slope.
- (b) When used in connection with a whorl pattern (5-9) the exponent 3 indicates that the pattern in question shows a radial slope or direction (rarely outside digit II).
- (c) The exponent n (found only in loop patterns) indicates that this pattern is a "nutant" one.

A "?" in the tables indicates that the print was not clear enough for eximination, thus the information could no be extracted from these prints.

Bibliography

- ANDERSEN, C. H. VOGELIUS (1958): Personidentificering. 87 p. (Copenhagen).
- ANDERSEN, C. H. VOGELIUS, LISBET GILBERG (in preparation): Polar Eskimo Finger- and Palmprints.

Polar Eskimo Palmprints (table 3, pp. 176-189):

Legend to palmprints:

Column 1-2: Thenar and Hypothenar.

"L" stands for ordinary loops running into the second-fourth interdigital (L^d) or the first intergital (L^r)*, in rare cases towards the basis of the thumb (L^1).

"Lu" runs against the ulnar area.

"A" stands for a vertical arch pattern (with no proximal carpal delta).

"La" stands for a curved loop pattern, the core of which is directed towards the proximal carpal delta.

In rare cases twin loops (TL) or tented arches (T) also occur in the thenar or hypothenar area.

Column 3: 4-finger crease.

"4-f." and (4-f.) stands for the more or less distinct 4-finger creases.

Column 4: Interdigitals.

"U" stands for the very ordinary loop pattern occurring in the four interdigital areas (1: between digits I/II; 2: between digits II/III; etc.).

"T" stands for a tented arch between two interdigital areas.

"A" denotes the absence of a delta below a finger, mostly digit IV.

Column 5: Exit of main-lines.

In this column the figures stand for the exits of main-lines D, C, and A (B omitted as being of no interest) when traced from the subdigital deltas d, c, and a. When one of these deltas is lacking ("A" in column 4) this fact is characterized by a minus in the present column. Figures in brackets only denote an approximation to another exit.

Column 6: Height of proximal carpal delta in %.

The heights of the proximal carpal deltas (t) have been measured in per cent of the total length of the palm, as measured between the carpal flexion crease and the flexion crease below digit III.

* A parathenar pattern occurs only once in this material, i.e. in the left hand of a female (E148).

Appendix C

Polar Eskimo Eye and Earlobe Data

by Aage Gilberg and Lisbet Gilberg

During a visit to the Thule District in North Greenland in the summer of 1963 (May–August) photos were obtained from 304 Polar Eskimos, age 10 or above. Each person's profile and face were recorded in black and white, and color photos were made of the profile at a 45° angle and of each eye. For further details, see GILBERG, 1976).

Polar Eskimo Eye and Earlobe data (table 4, pp. 190–196):

Legend for eye data:

- (A) Iris color 1: dark brown
 2: brown
 3: light brown
 4: brown/grey-brown
 5: brown/grey-blue
 6: brown/blue-blue
- (B) Eye folds M: Mongol fold
 E: Eskimo fold
 I: Indian fold
 Ep: Epicanthus
 ?: Uncharacteristic fold
 ÷: No fold
- (C) R.C. = Eye fold in relation to caruncula lacrimalis
 0: lack of fold
 1: touching of caruncula
 2: cutting across of the caruncula (covered)
 3: the entire caruncula is covered
- (D) Caruncula's form B: beak-shaped
 R: round
 T: triangular

- (E) Eye fissure form h: hemi-oval
 o: oval
 r: round
 s: slit-like
- (F) Eye fissure level 1: obliquely upward
 2: horisontal
 3: obliquely downward
- (G) Eyebrows form f: flat curved
 h: hemi-circular
 t: triangular
- (H) Earlobe form 1: + lobule
 2: middle form
 3: ÷ lobule

Appendix D

Polar Eskimo Anthropometrical Data

by Rolf Gilberg

During a visit to the Thule District in North Greenland in the summer of 1963 (May–August) 280 Polar Eskimos of all ages were measured. This represents a little over 50 % of the population. The type of anthropometrical data collected can be seen in figure 3.

On another visit to the Thule District (May–July 1969) anthropometrical data (see figure 4) were collected from 500 Polar Eskimos out of a population of 603 persons. 206 Polar Eskimos were measured both years.

Collecting Anthropometrical Data

Most Polar Eskimos were measured at the local hospital, in a school room, or at the midwife's home, but several were measured in their own homes and a few in tents on the hunting grounds or in a tent on the inland ice cap.

Although most Polar Eskimos patiently allowed their measurements to be taken, many may have thought the observer peculiar, a few children were afraid, and some old people preferred to be left alone, as of course they were.

In order to observe as many Polar Eskimos as possible, all settlements in the Thule District were visited, in some cases several times, for the Polar Eskimos are hunters and frequently on the move.

Results

The 1963-data have been published in 1975. The 1969-data are being processed and will be published later.
